

Make your planter more efficient, get a higher marketable yield, *and make more money.*

Bluefield Seeding Solutions is introducing its new patented **Seed Sensing Technology** that utilizes existing Press Wheel systems that improve plant spacing uniformity, but features enhanced press wheels that sense the contact with each seed piece while it's being locked in place by the press wheels during planting. This contact with the press wheels is at the precise time the seed piece becomes stationary in the furrow. This enables our system to give real time feedback of the actual seed placement on a per row basis, allowing the farmer to maximize planter performance and planting speed, no matter the conditions.

OUR SEED SENSING TECHNOLOGY WILL:

- **Deliver real-time feedback** of average seed spacing and planter's actual performance, allowing assessment and corrective action
- **Allow farm managers to monitor** planters performance remotely in real time via BSSI's mobile app
- **Automatically upload all seeding information** to a secure data storage platform where farmers can access their own data at any time, from anywhere
- **Accumulate all seeding data** for each field or seed lot: total planted, total seed weight, doubles, misses, less than ideal, and ideally planted seed
- **Allow for more efficient land use**, minimizing plant footprints and enabling better use of crop inputs
- **Monitor** the **seeding rate** (cwt/ac) and **average seed placing** in real time
- **Eliminate** digging behind planter to evaluate performance
- **Monitor** individual press wheels for slip

**LIMITED AVAILABILITY FOR 2023
